Page 300, line 48—For 1,026 Scotch read blank, and 1,026 French instead of blank.

VOLUME II.

Page 195—In totals for Canada in the column of tobacco read 11,266,732 instead of 12,266,732.

Page 73—In column of weeks of hired labor, district 106, read 26,902 instead of 53,902.

VOLUME III.

Page xxxiii. of Introduction—In table 28 for 6,328 read 6,329.

Page lxvi of English introduction—In column of employees read 46,951 instead of 47,951.

Pages lxxvii-lxxviii—Further investigation made since the printing of volume III. has resulted in showing that the comparative averages of wages and products per worker are not fair to Canadian industries. In the Canadian tables the number of wage-earners is the whole number employed during the year as given in the returns of manufacturers, while in the American tables it is an average computed in the census office from data of greatest and least numbers employed per month and of months in operation of manufacturing establishments in the year. The American method, which is explained at pp. ciii-cxxxiv. of the Introduction to volume VII., was unfortunately overlooked by the writer, and the effect of this discovery is to invalidate the comparative averages of wages per worker in columns 3 and 4 of table 43 as well as the comparative average of value of products in the last paragraph in the Introduction to the Canadian report (vol. III.), since the American averages would be substantially reduced if computed from the total number of wage-earners employed instead of a number which is an average of averages. In both Canadian and American tables the amount of earnings is made up from the actual returns entered in the schedules.

In the United States census of manufactures for 1900 a radical change was made in the method of ascertaining the average number of wage-earners for the entire year. Under the method of 1890 the number of wage-earners was an average for the actual time that the several establishments were in operation during the year, not an average for the whole year. Under the method adopted in 1900 the average number employed for one or more months by the several establishments was distributed throughout the whole year to obtain a statement of the average number for the year; and obviously, as said in the report, "the method adopted in 1900 tends to produce a smaller average number than the method employed in 1890." Neither for one census nor the other do the records show the total or greatest number of wage-earners employed, whereas in the Canadian census of 1901 this is the number returned and used.

The months in operation were not tabulated for the United States report to show full time, three-quarters time, half time, etc., as they have been in the Canadian one, but they were used as data to assist in computing the average number of employees, and it is stated that they were of great value in the census office in these computations.

To show the difference in the methods of 1890 and 1900, the U. S. census office made an examination of the returns for 12 industries, embracing brick and tile, cheese, butter and condensed milk, fish canning and preserving, flouring and grist mill products, fruit and vegetable canning and preserving, ice making, lumber and timber, oyster canning and preserving, sugar and molasses, vinegar and cider and wool hats, being a total of 78,175 establishments or more than one-seventh of all manufacturing establishments reported at the census. The value of products for those 12 industries in the census year of 1900 was $1,666,644,327 and the amount of wages for labor was $176,414,882. The average number of wage-earners was 475,473 computed on the method of 1900, and computed on the method of 1890 it would be 650,000; but even the last number, which is an average, must be less than the real whole number employed during the year, which is the number used in the Canadian tables.

Without knowing the whole number of wage-earners employed in United States establishments it is not possible to make a fair comparison of the average wage or average value of product per worker in the two countries, and as they stand in table 43 of the Canadian Introduction the comparisons of wages must be dismissed as things unlike.

When the method of dealing with the number of persons employed was under consideration in the United States census office the advice of several experts was invited, one of whom was Carroll Wright the well known statistician then in charge of the Department of Labour. In stating his opinion on the two methods submitted for consideration—namely (1) an average obtained by dividing the total number employed in all months the establishment was in operation by 12, irrespective of whether the establishment was in operation throughout the year, or (2) an average obtained by dividing the total number employed by the number of months that each individual establishment was in operation—Mr. Wright said:

"Of course neither method is scientific in its nature, but a scientific method would involve more labour than the results would warrant. My judgment as to the most correct way of statistically handling this information would be to ascertain the number of days each man was employed during the year in each establishment. You would then get the aggregate number of days' work of all the persons employed, on which you could easily secure what might be called a true average, but this method would involve so much labour and take so much time it would be impracticable in a Federal census."

Now, without knowing the opinion or judgment of Mr. Wright on the subject, what he favours as the correct and scientific way was adopted as part of the plan of the Canadian census of manufactures, and the results of it are shown in table III. for the provinces and in table IX. for the Dominion (vol. III.). The schedule called for the total number of men, women and children employed in each establishment, together with the total number of days and the wage earnings of each class of employees in the census year, and the statistics were compiled with only a small share of additional time or labour. It is possible therefore to compute from the tables not only the average wage-earnings of each class of workers in the year, but also the number of days they were employed in the year and the average wage of each person per day in each kind of industry for the several provinces and the Dominion, and so to compare one industry with another in the most interesting of all relations in the cost of production, namely, the side of it which touches man as a civilized and an industrial agent.

Pages lxxvii–lxxviii—Des recherches faites depuis la publication du volume III ont eu pour résultat de démontrer que les moyennes comparatives des gages et des produits par ouvrier ne rendent pas justice aux industries canadiennes. Dans les tableaux canadiens le nombre d'employés à gages est le nombre total employé durant l'année, tel que donné par les manufacturiers, tandis que dans les tableaux américains c'est une moyenne calculée dans le bureau du recensement sur les données, en plus et en moins, des nombres employés par mois et des mois d'opération des établissements manufacturiers durant l'année. La méthode américaine, expliquée aux pages iiii-cxxxiv de l'introduction au volume VII, avait malheureusement échappé à notre attention, et l'effet de cette découverte devra annuler les moyennes comparatives des gages par ouvrier dans les colonnes 3 et 4 du tableau 43, ainsi que la moyenne comparative de la valeur des produits au dernier paragraphe de l'introduction au rapport canadien, vol. III, vu que les moyennes américaines se trouveraient considérablement réduites si elles étaient calculées sur le nombre total des employés à gages, au lieu de l'être sur un nombre qui n'est qu'une moyenne de moyennes. Dans les deux tableaux canadien et américain le montant des gages a été pris sur les entrées faites dans les bulletins d'énumération.

Un changement radical a été fait dans la méthode d'établir les moyennes du nombre d'employés à gages pour l'année entière, dans le recensement des Etats-Unis en 1900. D'apres la méthode de 1890, le nombre d'employés à gages était une moyenne du temps actuel d'opération par différents établissements durant l'année, et non pas une moyenne pour l'année entière. D'après la méthode adoptée en 1900, la moyenne du nombre employé pour un ou pour plus d'un mois par les différents établissements, a été distribuée sur toute l'année afin d'obtenir un état du chiffre moyen pour l'année entière ; et naturellement, comme il est dit dans le rapport, "la méthode adoptée en 1900 tend à produire un chiffre moyen moins élevé que la méthode employée en 1890."

Ni l'un ni l'autre de ces deux recensements ne donne le total ou le plus grand nombre d'ouvriers employés, tandis que dans le recensement du Canada de 1901 ces chiffres sont donnés. Le nombre de mois d'opération n'a pas été mis en tableaux dans le rapport des Etats-Unis pour indiquer le temps complet, les trois-quarts du temps, la moitié du temps, etc., comme pour le rapport canadien, mais il a servi de donnée pour établir la moyenne du nombre d'employés, et on dit qu'il a été d'une grande valeur pour ces calculs au bureau du recensement.

Afin de montrer la différence des deux méthodes de 1890 et 1900, le bureau du recensement des Etats-Unis a fait examiner les bulletins d'énumération des douze industries suivantes: briqueterie et tuilerie, fabriques de fromage, beurre et lait condensé, salaisons et conserves de poisson, produits des moulins à farine, conserves de fruits et légumes, glace artificielle, bois, conserves d'huîtres, sucre et melasse, vinaigre et cidre, et chapeaux de laine, soit un total de 78,173 établissements ou plus d'un septième de tous les établissements manufacturiers dont il est fait rapport au recensement. La valeur des produits pour ces douze industries dans le recensement de 1900 s'élevait à $1,666,644,327 et le montant des gages pour travail à $176,414,882. La moyenne du nombre d'employés était de 475,473, calculée sur la méthode de 1900 et calculée sur celle de 1890 elle serait de 650,000, mais même le dernier chiffre, qui est une moyenne, doit être moindre que le nombre total réel employé durant l'année, ce qui est le nombre employé dans les tableaux canadiens.

Sans connaître le nombre total des ouvriers employés dans les établisements américains il n'est pas possible de faire une comparaison équitable de la moyenne des gages ou de la valeur moyenne des produits par ouvrier dans les deux pays, et telles qu'elles sont données au tableau 43 les comparaisons des gages doivent être considérées comme choses non comparables.

Lorsque la méthode de traiter du nombre de personnes employées fut discutée au bureau du recensement des Etats-Unis, on eut recours à l'expérience de plusieurs personnes versées dans les statistiques, au nombre desquelles se trouvait Carroll Wright, le statisticien bien connu alors en charge du Bureau du travail. En exprimant son opinion sur les deux méthodes sous considération—savoir (1) une moyenne obtenue en divisant par 12 le nombre total employé durant tous les mois d'opération d'un établissement, indépendamment du fait que l'établissement fût en opération durant toute l'année, ou (2) une moyenne obtenue en divisant le nombre total employé, par le nombre de mois d'opération de chaque établissement.—M. Wright s'exprima ainsi :

"De fait ni l'une ni l'autre de ces méthodes est scientifique dans son essence, mais une méthode scientifique entraînerait plus de travail que ne le justifieraient les résultats. Mon opinion quant à la manière la plus exacte au point de vue statistique de présenter ces renseignements, ce serait d'obtenir le nombre de

jours que chaque personne a été employée durant l'année dans chaque établissement. Vous auriez alors le nombre collectif de jours de travail de toutes les personnes employées, sur lequel vous pourriez facilement établir ce qu'on pourrait appeler une moyenne juste, mais cette méthode entraînerait tant de travail et tant de temps qu'elle serait impraticable dans un recensement fédéral."

Maintenant, sans connaître l'opinion ou le jugement de M. Wright en cette matière, ce qu'il préconise comme la manière la plus correcte et la plus scientifique a été adoptée comme partie du plan suivi pour le recensement des manufactures du Canada, et les résultats en sont donnés au tableau III pour les provinces et au tableau IX pour le Canada, vol. III.

Le bulletin d'énumération contenait des colonnes pour le nombre d'hommes, femmes et enfants employés dans chaque établissement, de même que pour le nombre total de jours et le montant des gages de chaque classe d'employés dans l'année du recensement, et les statistiques en ont été compilées sans trop de temps ni de travail additionnel. Il est donc possible par conséquent d'établir non seulement la moyenne des gages de chaque classe de travaillants dans l'année, mais aussi le nombre de jours qu'ils ont été employés durant l'année et la moyenne des gages de chaque personne par jour dans chaque espèce d'industrie, pour les différentes provinces et le Canada, et aussi de comparer une industrie avec une autre dans le plus intéressant de tous ses rapports, celui du coût de la production, ce côté qui intéresse l'homme comme agent éclairé et industriel.

NOTE—It is well recognized that the mortality returns of a census are never full. They are often ten per cent or more below the actual deaths, as verified by local registration and other sources of information. Indeed, no method of procuring mortality statistics is quite satisfactory, not even when the law requires registration to be made with a government or municipal officer before a burial permit can issue. In Canada provincial registration is well organized in Ontario and Quebec, and in the case of these provinces an effort was made to supplement the census returns by comparison with the local records. It was found, however that this could not be done for Quebec without more time than could be spared for the work, owing to the common practice in the parishes there of recording married women under their maiden names; but it is hoped that statistics compiled from both sources can be prepared for a projected bulletin on mortality, to be issued in 1906. For Ontario the comparison was very carefully made, name by name, and after striking out duplicates and the still-born the total mortality for the census year in a population of 2,182,947 was ascertained to be 33,272, as given in the foregoing table. This is 6,243 more than the returns made by census enumerators, and 3,244 more than the provincial records show, exclusive of still-born. In the state of Michigan, where the same method of making up the mortality statistics was pursued for the United States census of 1900, the total mortality in a population of 2,420,982 was ascertained to be 33,572, which is 9,961 more than the returns of census enumerators and 2,468 more than the state records show. If the census returns were as full in proportion as those for Ontario the number of deaths in the state would be larger than it appears, and consequently the death rate would be higher. For Ontario it is 15·24 per 1,000. The following table shows for census districts in the province the number of deaths returned by enumerators, the number added from the local records, and the total number as so obtained.

NOTE—C'est un fait reconnu que les recensements de la mortalité ne sont jamais complets. Les relevés donnent souvent dix pour cent et plus au-dessous des chiffres vérifiés par l'enregistrement local ou autre source de renseignements. De fait aucune méthode pour recueillir la statistique de la mortalité ne donne pleine satisfaction, pas même lorsque la loi exige que l'enregistrement d'un décès soit fait par un officier du gouvernement ou un employé municipal avant qu'un permis ne soit donné pour inhumation. Au Canada l'enregistrement provincial est bien organisé dans Ontario et Québec, et dans le cas de ces deux provinces il a été fait un effort pour arriver à comparer les chiffres du recensement avec ceux des bureaux provinciaux. On a trouvé cependant que la chose ne pouvait se faire pour Québec, sans consacrer à ce travail plus de temps qu'il n'était possible d'y mettre, vu que, suivant une vieille coutume, les décès de femmes mariées y sont enregistrés sous leurs noms de filles; mais on espère que les statistiques compilées des deux sources pourront être préparées à temps pour être données dans un bulletin qu'on se propose de publier sur la mortalité en 1906. Les comparaisons dans Ontario ont été faites avec beaucoup de soin, nom par nom, et après avoir rayé tous les cas de duplication, ainsi que les cas de morts-nés, le chiffre de la mortalité totale pour l'année de recensement dans une population de 2,182,947 se trouve être de 33,272, tel que donné au tableau précédent. Ceci est de 6,243 plus élevé que les rapports faits par les énumérateurs du recensement, et de 3,244 plus élevé que les rapports des registres provinciaux, non compris les mort-nés. Dans l'Etat du Michigan où la même méthode a été suivie par le bureau du recensement des Etats-Unis en 1900, la mortalité totale dans une population de 2,420,982 se trouve être de 33,572, ce qui fait 9,961 de plus que par les rapports des énumérateurs et 2,468 de plus que les rapports des registres locaux. Si les rapports des énumérateurs du recensement étaient aussi complets en proportion que le sont ceux d'Ontario, le nombre de décès dans le pays serait plus grand qu'il ne paraît et par conséquent le taux de mortalité plus élevée. Pour Ontario il est de 15·24 par 1,000. Le tableau suivant donne par districts de recensement le nombre de décès dont il a été fait rapport par les énumérateurs de la province, le nombre de ceux qui ont été ajoutés des registres locaux, et le nombre total ainsi obtenu.

NOTE—In many instances the enumerators failed to report the number of rooms in colleges and schools, and the number of teachers and professors employed in these institutions. It is also certain that in each province a number of private schools and some institutions of learning were overlooked, or not specified.

NOTE—Dans bien des cas le nombre de chambres dans les collèges et écoles, de même que le nombre d'instituteurs et de professeurs employés dans ces institutions, n'a pas été entré par l'énumerateur. Il n'y a aucun doute aussi que dans chaque province un certain nombre d'écoles privées et quelques maisons d'éducation ont été omises ou n'ont pas été spécifiées.
